

ABSTRACT

The present invention relates to a latching device for securing two panels together such as those of storage structures in which an enclosure is secured by means of a door or panel which will remain in a closed position until released. The present latching system is usually
5 used in connection with automobile glove boxes or other compartments which are to be secured for storage of items therein. The latching device has a housing, actuation means and a pawl in communication with a movable retention means. The latching device can be electrically or manually operated.
